Problem Space

Introduction

P.S. – Intro of companies attached in annexure

Objective:

The objective of this assessment is to demonstrate how Beacon. li's AI orchestration platform can deliver additional value to enterprise prospects that already possess advanced AI capabilities by designing original and practical agentic AI features that further enhance automation, efficiency, or intelligence in their products—even within AI-native environments.

Prospect Overview: [Deel](#)

Market research is a critical first step in product strategy because it helps identify where opportunities exist, even for AI-first companies that already have mature capabilities. By analysing the market focus, offerings, customer profile, AI adoption, and strategic gaps of potential prospects, we can determine where Beacon's agentic AI can deliver the most impact. I chose Deel as the focus prospect because of its leadership in global payroll and HR for remote teams, its large customer base of 35,000+ businesses, and its high level of AI adoption. It is also one of the fastest-growing unicorns the world has ever seen, with very high growth and a moderate risk appetite.

Analysis: Gaps

A recurring theme among users of Deel was that the UI was complex, and they struggled to keep up with these complexities and found it hard to navigate the web version of Deel.

A lot of users mentioned facing problems related to the mobile application of Deel, stating that they were not able to find a resolution for even basic tasks that they would've liked to get accomplished via the same.

My approach to assessing this was understanding what satisfied and dissatisfied users of Deel had to say about their experience using the platform. Since I had limited time and couldn't conduct user interviews, I accessed the largest testimonials collection of Deel users, i.e. G2, where Deel has over 10,000+ registered reviews with a detailed breakdown.

Source:

<https://www.g2.com/products/deel/reviews>

Limitations, pain points, or areas lacking automation or intelligence.

Gap 1: Lack of Embedded, Real-Time AI Agents for Contextual User Guidance

A collage of screenshots of user reviews from the G2 website.

Many Deel users struggle to quickly resolve complex, unfamiliar, or nuanced issues within the platform, especially when navigating intricate workflows or needing clarification in the moment. Current support options often rely on static help centres, delayed customer service, or generic AI responses, resulting in user frustration, inefficiency, and workflow interruptions. This gap leads to slower onboarding, more frequent errors, and higher support ticket volumes. The absence of embedded, real-time AI agents that provide contextual guidance and proactive troubleshooting leaves users without the tailored, instant assistance they need, particularly during critical or confusing platform interactions.

Gap 2: Incomplete Mobile Feature Parity and User Experience

A collage of screenshots of user reviews from the G2 website.

Many Deel users rely on mobile devices for critical HR and payroll tasks, but frequently encounter a mobile app that lacks the full functionality, speed, and usability of the desktop platform. Reviews highlight frustration with missing features, slow performance, clunky navigation, and uneven user experience on mobile compared to the web. Users report difficulty accessing key information, managing documents, or completing urgent actions on the go—especially when travelling or working remotely. Closing this gap by bringing true feature parity and a seamless, responsive experience to mobile would directly address a major pain point and drive higher engagement, satisfaction, and productivity for global teams.

Solution Space

Ideated Solution 1:

Contextual In-Platform AI Overlay Agent

Addressing Gap 1: Lack of Embedded, Real-Time AI Agents for Contextual User Guidance

Description of Functionality:

An intelligent, in-platform overlay agent that delivers real-time, step-by-step guidance, troubleshooting, and personalised suggestions as users navigate Deel's workflows.

How It Works (Workflow/User Interaction):

- Detects user actions and workflow context across all Deel modules.
- Instantly appears as an overlay/icon in a corner when users face complex tasks, errors, or hesitation. (Discussed broadly in Execution Space)
- Offers tailored instructions, highlights next steps, auto-fills data where possible, and answers context-specific questions via natural language.
- Proactively surfaces relevant checklists, helps resolve errors, and escalates unresolved issues to live support or auto-executes fixes if permitted.
- Learns from user behaviour to continuously improve recommendations and guidance.

Target Users/Roles Who Benefit:

- HR and payroll admins
- New employees, contractors, or onboarding users
- Managers and team leads handling compliance, IT, or payroll workflows
- Customer support teams (fewer tickets, faster resolution)

Business Outcomes and Impact:

- Faster onboarding and reduced training effort
- Fewer user errors and workflow interruptions
- Lower support ticket volume and faster issue resolution
- Higher user confidence, adoption, and satisfaction
- Improved productivity for all user types

North Star Metric:

Reduction in User Support Ticket Volume and Average Resolution Time

How to Measure (Mixpanel):

- Track how often users resolve issues after engaging with the AI overlay (vs. submitting a support ticket).
- Compare support ticket volume and average resolution time before and after agent deployment.
- Trigger a quick in-app satisfaction survey post-agent interaction.

Success

Fewer support tickets, faster issue resolution, and higher immediate user satisfaction after using the AI agent.

Execution: UX and Plan

UX

User flow and functionality

1. User & Platform Context Understanding
 - a. On setup, the agent scans the user profile, permissions, and relevant documents to anticipate likely pain points based on their role and activity history.
 - b. With demo account access, the agent fully maps Deel's interface and workflows for precise overlay and guidance.
2. Initial Personalization
 - a. On first activation, the agent asks a few quick questions about the user's experience and biggest challenges using Deel, tuning its suggestions to personal needs.
3. Smart Overlay Activation
 - a. The agent appears as a hovering icon. Users click the icon, then highlight (or describe) areas where they're stuck, similar to making a contextual screenshot.
4. Contextual Help Workflow
 - a. The agent analyses the selected area and user input, understanding the job-to-be-done.
 - b. If needed, it asks clarifying questions to refine its diagnosis.
5. Guided Problem Resolution
 - a. Presents the user with a concise, structured answer:
 - i. What's the problem
 - ii. How to solve it (step-by-step guidance)
 - iii. Can Deel currently handle the request?
 - iv. Can the agent solve it for the user (auto-action with permission)?
 - v. DIY workaround if possible
 - vi. Option to request a new feature from Deel for future improvement
6. Continuous Learning
 - a. Every interaction refines the agent's guidance and personalisation for future support.

Wireframes for demonstration

Wireframe 1: Action button acting as an entry point for agent activation

Wireframe 2: User is prompted to select the area of interest

Wireframe 3: Agent comes up with a guided solution

P.S.: Due to limitations in time, I've limited low-fidelity wireframes to 3. Upon request, can illustrate the solution using more wireframes

Plan

Validation Approach:

- Conduct user interviews and journey mapping to surface specific pain points.
- Build interactive prototypes for core scenarios and validate with targeted usability testing.
- Iterate with real user feedback to refine guidance, overlay behaviour, and permissions.

Launch Plan:

- Begin with a small pilot group (phased rollout), closely monitoring engagement and task completion.
- Collect in-app user feedback and measure KPIs: overlay activations, ticket deflections, and task resolution time.
- Expand access incrementally as improvements are made.

Key Risks & Challenges:

- Integration with existing Deel workflows and data
- Driving end-user adoption and trust
- Ensuring data privacy and platform security

Mitigation Strategies:

- Collaborate with Deel on technical integration from day one
- Provide in-app onboarding, transparency, and opt-in permissions
- Comply with enterprise security mandates and regularly audit data access

Ideated Solution 2:

Companion Mode: Intelligent, Contextual Mobile Assistance

Addressing Gap 2: Incomplete Mobile Feature Parity and User Experience

Description of Functionality:

A companion mode within Deel's existing mobile app, powered by LLM-based, context-aware orchestrator cloud agents. This feature provides real-time, intelligent guidance and automated task support on mobile, mirroring desktop functionality and empowering users to complete complex HR tasks anywhere with seamless, conversational assistance.

How It Works (Workflow/User Interaction):

- **Contextual Backend Sync:** Companion mode is continuously updated with the user's desktop activity, task history, and workflow patterns, allowing seamless task handoff and context retention.
- **Automated Workflow Mapping:** The agent tracks recurring and ongoing workflows (e.g., monthly payroll, leave approvals) and builds operational "recipes." Users are notified when a workflow is mapped and can run or review these flows via mobile.
- **Updates & Smart Alerts:** The assistant surfaces all action items, recent changes, and pending tasks in a dedicated updates section—prioritised by urgency and relevance.
- **Conversational Context Tuning:** Users can chat with the copilot to update preferences, clarify current goals, or adjust task flows. The LLM's inbuilt memory dynamically evolves to reflect this input.
- **Mobile-First Task Execution:** Users can request, review, or execute mapped workflows from anywhere, and the agent guides them, surfacing necessary forms and confirming completion.

- Proactive Issue Resolution & FAQ: The copilot recognises stalled tasks, prompts the user with reminders, and auto-resolves common issues (e.g., missing data, form errors) on mobile—reducing friction and the need for support tickets.
- Quick Document & Screenshot Actions: Users can upload documents, snap photos, or screen areas within the app for instant, guided processing (e.g., receipts, compliance docs).
- Personalised Tips and Feature Introduction: On mobile, the companion highlights overlooked or new features, helping users discover time-saving actions or shortcuts relevant to their patterns.

Target Users/Roles Who Benefit:

- HR and payroll admins needing to manage tasks on the go
- Managers and team leads reviewing approvals, performance, or compliance remotely
- Employees and contractors submitting documents, timesheets, or requests via mobile
- Travelling staff and executives need instant access to updates and workflows

Business Outcomes and Impact:

- Seamless mobile and desktop experience
- Faster, error-free task completion on mobile
- Increased mobile user satisfaction and engagement
- Fewer mobile-related support requests
- Higher productivity for remote and distributed teams

North Star Metric:

% Reduction in Manual Effort and Time Spent on Repetitive Tasks

How to Measure (Mixpanel):

- Track the time taken to complete recurring workflows before and after AI agent adoption
- Monitor user reliance on AI-driven workflow automation vs. manual entry
- Measure frequency and speed of automated vs. manual task completions

Success

Users spend less time on repetitive tasks, increasingly leverage AI workflow automation, and complete actions more efficiently.

Execution: UX and Plan

UX: Wireframes for demonstration

Wireframe 1: Suggestion for adding a recurring workflow

Wireframe 2: Wireframe showing a prioritised, real-time feed of pending tasks, recent changes, and action items, allowing fast access and one-tap execution.

P.S.: Due to limitations in time, I've limited low-fidelity wireframes to 2. Upon request, can illustrate the solution using more wireframes

Plan

Validation Approach:

- User interviews and task analysis on mobile workflows
- Prototype testing and mobile app usability sessions
- Iterate with early pilot feedback

Launch Plan:

- Pilot release to selected mobile users with A/B tests and feedback loops
- Track task automation/adoption and satisfaction metrics
- Gradual rollout with continuous feedback and feature tuning

Key Risks & Challenges:

- Integration with existing Deel workflows and data
- Driving end-user adoption and trust

Mitigation Strategies:

- Robust QA and sync testing for workflows
- Clear onboarding, user education, and opt-in controls
- Mobile user interviews and journey mapping
- Rapid prototyping with usability testing
- Feedback loops from early mobile adopters

Annexure

[Beacon.li](#) Overview

Context

Beacon.li

Beacon.li is an enterprise AI orchestration platform that accelerates business processes by automating complex workflows, enhancing product adoption, and delivering autonomous support. It uses agentic AI agents to streamline onboarding, reduce errors, and provide real-time insights across HR, SaaS, BFSI, retail, and more. Beacon.li empowers organisations to boost operational velocity and efficiency with scalable, no-code AI-driven automation.

Implementation Process of [Beacon.li](#)

Step-by-Step Flow of Beacon.li Implementation

1. Initial Access and Product Learning
 - a. The process begins by granting Beacon.li's platform access to a demo account of the client's product; there is no need for backend access or integration with APIs or databases.
 - b. Beacon's AI reads, maps, and learns the product interface and workflows directly from the UI—no technical documentation, no code, and no engineering resources required.
2. Automation of Requirements Gathering and Validation
 - a. The platform then uses AI agents to automate the complex process of gathering client requirements, extracting and validating data, and configuring system workflows, imitating what a highly skilled implementation specialist would do, only much faster and at enterprise scale.
 - b. Beacon utilises specialised agents for specific tasks: extracting unstructured data, transforming it, reviewing and applying feedback, validating it, and finally loading it into required formats or systems.
3. Zero-Code Deployment
 - a. All orchestration is handled above the application layer with a zero-code engine—meaning neither customer IT teams nor specialist developers are required for system configuration.
4. Conversational Configuration and Post-Implementation Support
 - a. Clients interact through natural language, guided by an "AI Copilot" that makes even complex configurations accessible through simple conversations.
 - b. After deployment, AI-powered support agents remain available for guidance, troubleshooting, and handling FAQs, reducing the dependency on human support teams.
5. Go-Live and Efficiency Gains
 - a. Beacon condenses months-long rollouts into 2–4 week sprints. This delivers 50% faster revenue recognition, significant resource and cost savings, and higher adoption rates by users

Deel Overview

Prioritization Matrix

Prospect	Market & Focus	Main Offerings	Customer Profile	AI Adoption Level	Strategic Needs & Gaps
Deel	Global payroll & HR for remote teams	Payroll, compliance, onboarding, taxes, HRIS	35K+ global businesses	High; automation, reporting & support	Cross-border compliance, onboarding acceleration, proactive support
ZipHQ	Procurement automation for enterprises	Procurement ops, compliance tracking, vendor management	Large enterprises	Medium; workflow automation, tracking	Advanced analytics, ticket resolution, contextual onboarding
Zluri	Identity & access governance (IGA)	Identity visibility, policy enforcement, risk detection	Security-driven orgs	High; real-time risk, data fabric, automation	Multi-app workflow automation, contextual reporting, RPA expansion
Spendflo	SaaS procurement & spend optimization	Intake, vendor management, license, risk, PO/contract	Finance & IT teams	Medium; insights, pricing, reporting	Smart automation, ticket handling, predictive spend analytics
Rippling	Unified workforce management	HR, payroll, compliance, IT, spend, all-in-one management	Growth-stage to large orgs	Very high; no-code, integration, AI flows	Multi-suite orchestration, deep cross-module workflows, adaptive insights

Company background and market positioning

Deel is a global workforce platform designed for remote-first organisations, enabling seamless payroll, compliance, and HR management across 140+ countries. Its unique infrastructure ownership, rapid expansion, and open-integrations approach set it apart from traditional providers, supporting fast, reliable scaling for companies of all sizes.

Source: [Brandon Hall Group](#)

- Owns legal/payroll infrastructure globally for direct control and faster issue resolution
- Achieved \$1B+ revenue at record speed, proving strong market demand
- Provides a unified platform for payroll, HR, IT, compliance, and operations
- Maintains the largest global work compliance knowledge base, updated by in-house experts
- Supports flexible integrations with existing HR tools, reducing adoption friction
- Positioned for startups, mid-market, enterprise, and M&A-driven global expansion

Main product offerings

Deel Payroll

- Real-time, automated payroll processing across 120+ countries
- Employer of Record (EOR) and contractor payment solutions
- Local tax, benefits, and compliance management
- Multi-currency support and integration with accounting systems

Deel HR

- Global HRIS for all worker types, onboarding/offboarding automation
- Compliance monitoring, document management, and workforce analytics
- Performance, compensation, time-off, and talent management tools
- AI-powered insights for planning and efficiency

Deel IT

- End-to-end device procurement, global supply, and app management
- Mobile device management (MDM), identity, and access control
- IT asset tracking, catalogue/order management, policy enforcement
- Secures data and automates IT onboarding/offboarding

Deel Services

- Comprehensive equity and privacy consulting (110+ countries)
- Visa support, HR advisory, entity setup, immigration management
- Custom benefits administration and tailored compliance services

Platform

- Unified dashboard integrating payroll, HR, IT, and services
- Seamless integration with external HR/accounting systems
- Self-serve automation, reporting, and workflow orchestration
- Secure, scalable infrastructure for global operations

Current AI features and capabilities

Deels AI-driven offerings/tools that they provide alongside their product suite: [Deels Global Hiring ToolKit](#)

Deel AI:

An AI-powered assistant that provides instant, contextual answers on compliance, workflows, reporting, and hiring to HR teams directly in the platform. It acts as a virtual advisor, improving decision speed and reducing support burden.

Deel Advance:

Enables eligible independent contractors to get short-term, interest-free cash advances on earned wages, adding financial flexibility. This is widely appreciated by gig and contract workers.

Compliance Monitoring & Automation:

Continual tracking of labour laws, tax regulations, and payroll compliance with smart alerts to reduce legal risks globally. Automated governance workflows and country-specific compliance templates.

Role-Based Access and Security:

Flexible role assignments and permissions ensure secure HR operations, data privacy, and compliance with enterprise standards.

Onboarding Automation & Team Introductions:

Pre-built workflows and notifications that automate new hire processes and introduce them to the right team members based on the org chart.

Employee Engagement Tools:

Pulse surveys and goal tracking features to measure and improve employee satisfaction and productivity.

Talent and Compensation Management:

Integrated compensation planning and talent sourcing management tools to streamline hiring and pay bands globally.

Integrations with Accounting & Communication Tools (e.g., QuickBooks, Slack):

Automate accounting sync, invoice management, and enhance team collaboration through popular tools
